

Transport data services are addressed to companies which have multiple sites located in different geographic areas. Such a network allows secured data transfer (documents, services of CRM, ERP, VoIP, video call, video conference type), by private IP classes, as well as the development of policies for prioritization of services which are important to a company (voice calls, video, video conferences).

- ❖ This type of connection serves, in particular, those who want to interconnect offices, without having to use additional equipment for encryption and configuration of private networks. In this way, it is limited the delay in data transmission and the quality decrease in voice over IP and video over IP services

Features and benefits:

- ✓ building a secure and transparent network;
- ✓ the possibility of working, in real time, from any of the clients' addresses;
- ✓ the advantage of interconnecting and concentrating the internet and telephone services in one location;
- ✓ administration and management of IT resources;
- ✓ implementation of Quality of Service policies.
