

Layer 3 transport services, serve companies with offices located in different geographical areas requiring permanent transfer of data. The network is secure and uses a VPN structure type, in which can be used private IP classes, characteristic of each establishment in part (documents, CRM, ERP, VoIP, video call, video conference services). This service only requires the fixing by the customer of IP classes for each address. This is an option that provides a large part of the Layer 2 connections benefit, at lower costs.

- ❖ Layer 3 type connections are used for interconnecting offices, without investing in additional equipment for encryption.

Features and benefits:

- ✓ cost efficiency
- ✓ the possibility to achieve your own secure and transparent network, at both national and global level
- ✓ the possibility of working, in real time, from any of the clients' addresses
- ✓ the advantage of interconnecting and concentrating the internet and telephone services in one location
- ✓ administration and management of IT resources
