

The increasing needs for interconnection between offices in different geographic areas, both of large companies and small and medium-sized enterprises, has led to the approach of such providers, to develop virtual private networking solutions. The development of private networks over the internet service is an efficient way from the costs point of view for interconnection between all addresses. Thus, any of the customer's premises will communicate with all other locations..

- ❖ VPN services are an option with very good price quality ratio for companies without special needs regarding data transfer (capacity - response time). Because of the development of the VPN service, most internal applications can be easily integrated over such a communication network.

Features and benefits:

- ✓ Fast implementation scheme
- ✓ Easy management
- ✓ Cost effective solution in terms of equipment price
- ✓ Security thru data encription
- ✓ Central management of all IT resources.
