

The increasing needs for interconnection between offices in different geographic areas, both of large companies and small and medium-sized enterprises, has led to the approach of such providers, to develop virtual private networking solutions. The development of private networks over the Internet is a cost effective way to interconnect a main headquarter with one or more secondary locations. This dedicated network uses the Internet capabilities already incurred to achieve secure connections, hardware or software, for company's internal applications (CRM, ERP, archive documents, internal communication systems - voice, text messages).

- ❖ VPN services are an option with very good price quality ratio for companies without special needs regarding data transfer (capacity - response time). Because of the VPN service development, most internal applications can be easily integrated over such a communication network.

AVANTAJE ȘI BENEFICIIL:

- ✓ Fast implementation scheme
- ✓ Easy management
- ✓ Cost effective solution in terms of equipment price
- ✓ Security thru data encliption
- ✓ Central management of all IT resources.
