

Viva Telecom has launched its own Virtual Server Hosting Service to provide its customers the possibility to use professional servers configured in order to share resources among multiple users. This service is addressed to companies which are running programs specific to their activities, having an opportunity to install and configure their own services. Sharing a server resources is an effective method to use to the maximum the capacity available with the investment in such instrument.

- ❖ By setting up a server, to be used as virtual machine, each user uses shared the following resources: CPU, disk space, RAM, communications means. Each user has the same rights to use these hardware resources, the information being private and without any risk that another user will be able to access them.

Advantages and Benefits:

- ✓ customer does not have to invest in expensive equipment, which in time will lose its value
- ✓ the client, by purchasing this service has same benefit as well as their own possession of a server collocated in a data center
- ✓ maintenance operations shall be carried by the supplier. Thus, the customer does not have to carry out these operations which may bring additional costs, both in terms of time spent, as well as by acquiring the components
