

Interconnection of a customer series through a "star" or "fullmesh" VoIP network lead to the creation of a private network of telephony, using both infrastructure and capacities of data transfer. The way to achieve this network is simple and involves some dedicated appliances in each address of the user. According to the technical solution, these types of services can operate including inside VPN networks..

- ❖ Unlike VPN channels, Voice over IP (VoIP) solution use the communications capacity resouces only during the period for carrying out a call. Voice over IP (VoIP) interconnection of sites allows using a single telephone central group, calls between various branches turning into calls between extensions..

### Advantages and Benefits:

- ✓ Allows for centalised control over the voice network
- ✓ Reduction of telephony cost by making calls with the same department over a national network free of charge
- ✓ Allow for easy relocation of entire departments.
